### Chemistry Combined Gas Law Problems

Combined Gas Law Problems 1) A sample of sulfur dioxide occupies a volume of 652 mL at 40.° C and 720 mm Hg. What volume will the sulfur dioxide occupy at STP? 2) A sample of argon has a volume of 5.0 dm<sup>3</sup> and the pressure is 0.92 atm. If the final temperature is 30.° C, the final volume is 5.7 L, and the final

Sample Problems For Using The Ideal Gas Law,  $PV = nRT$ . Examples: 2.3 moles of Helium gas are at a pressure of 1.70 atm, and the temperature is 41°C. What is the volume of the gas? At a certain temperature, 3.24 moles of CO<sub>2</sub> gas at 2.15 atm take up a volume of 35.28L. What is this temperature (in Celsius)? Show Video Lesson

Boyle's Law-Related Problem. An 18.10mL sample of gas is at 3.500 atm. What will be the volume if the pressure becomes 2.500 atm, with a fixed amount of gas and temperature? Solution: By solving with the help of Boyle's law equation.  $P_1 V_1 = P_2 V_2$ .  $V_2 = P_1 V_1 / P_2$ .  $V_2 = (18.10 * 3.500\text{atm})/2.500\text{atm}$ .  $V_2 = 25.34$  mL. ### Chemistry Combined Gas Law Problems Answer Key

There are a couple of common equations for writing the combined gas law. The classic law relates Boyle's law and Charles' law to state:  $PV/T = k$ . where P = pressure, V = volume, T = absolute temperature (Kelvin), and k = constant. The constant k is a true constant if the number of moles of the gas doesn't change.

PROBLEM 7.2. 3 One way to state Boyle's law is "All other things being equal, the pressure of a gas is inversely proportional to its volume." (a) What is the meaning of the term "inversely proportional?" (b) What are the "other things" that must be equal?

This is a combination of three gas laws, which are Boyle's law, Charles's law and Gay Lussac's law. This can also be derived from the ideal gas law. In other words, the three said laws can also be obtained from this equation by simply assuming a property (volume, pressure or temperature) to be constant.

By John T. Moore. Part of Chemistry For Dummies Cheat Sheet. When studying the properties of gases, you need to know the relationships between the variables of volume (V), pressure (P), Kelvin temperature (T), and the amount in moles (n) so that you can calculate missing information (P, V, T, or n) and solve reaction stoichiometry problems. Although the pairs of variables have individual relationships, the two most important and useful gas laws are the combined gas law and the ideal gas law:

The Combined Gas Law and Ideal Gas Law - dummies

The ideal gas law is an equation of state that describes the behavior of an ideal gas and also a real gas under conditions of ordinary temperature and low pressure. This is one of the most useful gas laws to know because it can be used to find pressure, volume, number of moles, or temperature of a gas. The formula for the ideal gas law is:  $PV = nRT$ . P = pressure.
