IC engine converts chemical energy of the fuel into mechanical energy, usually made available on a rotating output shaft. Chemical energy of the fuel is first converted to thermal energy by means of combustion or oxidation with air inside the engine, raising the T and p of the gases within the combustion chamber.

Internal combustion engines are devices that generate work using the products of combustion as the working fluid rather than as a heat transfer medium. To produce work, the combustion is carried out in a manner that produces high-pressure combustion products that can be expanded through a turbine or piston.

The principle of working of both SI and CI engines are almost the same except the process of the fuel combustion. In SI engines, the burning of fuel occurs by a spark generated by the spark plug. In CI engines the burning of the fuel occurs due to compression of the fuel to excessively high pressures which does not require any spark.
