After LTE optimization by using Automatic Cell Planning (ACP), Automatic Frequency Planning (AFP), Monte-Carlo algorithm and neighbor planning, the coverage, signal level and throughput have been improved. In addition, overlapping has been reduced. The optimization process improves the coverage rate from 90% up to 98.04%, Carrier-to-Interference-and-Noise Ratio (CINR) from 65.04% up to 77.6%, and total traffic supported by the network increases after the optimization by 30%.

The aim of radio network planning is to balance coverage, capacity, quality, and cost so none of these can be considered in isolation. Various factors must be considered during LTE system coverage planning and setting of these parameters will affect coverage radius and the quantity of base stations.

Understanding Radio Access Network (RAN) in 4G & 5G LTE. A Radio Access Network (RAN) is the part of a telecommunications system that connects individual devices to other parts of a network through radio connections. A RAN resides between user equipment, such as a mobile phone, a computer or any remotely controlled machine, and provides the connection with its core network.

Atoll provides fully integrated single-RAN – multi-RAT network planning and optimisation features for both 3GPP and 3GPP2 radio access technologies including 5G NR, LTE, NB-IoT, UMTS, GSM and CDMA. Atoll radio planning and optimisation software also provides full support for the latest advances in wireless technologies such as massive MIMO, 3D beamforming and mmWave propagation for the design and roll-out of 5G networks.

LTE Radio Planning. As many service providers continue to enhance their 4G coverage, this course provides a fundamental understanding of the factors which must be considered as part of the planning process. Topic areas include the overall network design process, factoring in the QoS demands associated with different services.

UTRAN: UMTS radio access network; E-UTRAN: The Long Term Evolution (LTE) high speed and low latency radio access network; It is also possible for a single handset/phone to be simultaneously connected to multiple radio access networks. Handsets capable of this are sometimes called dual-mode handsets. For instance it is common for handsets to support both GSM and UMTS (a.k.a. "3G") radio access technologies.

YateBTS is a software implementation of a GSM/GPRS radio access network based on Yate and is compatible with both 2.5G and 4G core networks comprised in our YateUCN unified core network server. Resiliency, customization and technology independence are the main attributes of YateBTS. YateENB is the LTE software eNodeB, based on Yate.
