Abstract: Theoretical analysis, physical reasonings, and experimental verifications are presented for a frequency selective surface with circular ring elements. Both double-screen and single-screen designs are generated for a tri-band system that reflects the X-band signal while transmitting through the S- and Ku-band signals. In these designs, the dielectric loading effect is used to reduce ring size and element spacing and thus avoid the grating lobe problem.

MyMB band selective repeater not only let you to choose one telco signal band, you could choose 2 or 3 telco signal band and get rid of the rest if those selected telco signal band are next to each other. For example, you could select Celcom and Digi 3G band and get rid of Maxis and U Mobile as Celcom and Digi 3G band are next to each other, you could not select Digi and Maxis 3G band because they are separated by Digi 3G band.

Tri-band frequency selective surface with circular ring elements Abstract: A metallic ring has been proposed as the resonant element for a triband frequency selective surface (FSS). Dielectric substrate material with a high dielectric constant is employed to reduce the ring size and thus the element spacing for avoiding grating lobes at the highest frequency.

the three or more multi-band FSSs with a tuned-independent response will be very useful. The objective of our work is to design a tri-band, band-pass FSS with highly-selective, broad band characteristics using a sandwiched structure. The proposed FSS includes two identical layers of periodic metallic arrays, which are separated by a foam layer.

Through in-situ diffuse reflection infrared fourier transform spectroscopy (DRIFTS) measurements and density function theory (DFT) calculations, we found that metal cations in LDH structure with d band positions (d) near the Fermi level (e.g., Ti 4+, Ga 3+ and Al 3+) promoted CO 2 adsorption and activation, resulting in selective CO 2 photoreduction to carbon-containing products.

What is Triband? / Cobham-sync

The tri band bandpass filtering response is implemented by using a pair of varactor loaded square split rings, an open stub and a one end shorted closed loop ring. By loading an open stub at the central position of the proposed resonator, the odd mode resonance can be split into two modes for generating high selective tunable passband.
