and enable fast flood irrigation of undulating land without the need for terracing it. Keyline designs include irrigation dams equipped with through-the-wall lockpipe systems, gravity feed irrigation, stock water, and yard water. Graded earthen channels may be interlinked to broaden the catchment areas of high dams, conserve the height of water, and transfer rainfall runoff into the most efficient high dam sites.

The first aim of Keyline is to provide simple means of conserving all the rain that falls into the soil itself, retard its evaporation rate and use the conserved moisture for the improvement of soil fertility

Helps farmers capture water in areas they want to, and avoid having water flow immediately to the low point.

During his years as a scientist working for the British government in India, Sir Albert Howard conceived

of and refined the principles of organic agriculture. Howard's *The Soil and Health* became a seminal and inspirational text in the organic movement soon after its publication in 1945. *The Soil and Health* argues that industrial agriculture, emergent in Howard's era and dominant today, disrupts the delicate balance of nature and irrevocably robs the soil of its fertility. Howard's classic treatise links the burgeoning health crises facing crops, livestock, and humanity to this radical degradation of the Earth's soil. His message—that we must respect and restore the

health of the soil for the  
benefit of future  
generations—still resonates  
among those who are  
concerned about the effects  
of chemically enhanced  
agriculture.
